Further Reading    xv

    Economics    xv

    Behavioral Ecology    xv

Preface    xvii

## **I    Historical Approaches    1**

### **1    René Descartes and the Birth of Neuroscience    3**

    Vaucanson's Duck    3

    René Descartes    5

    Understanding the Ancients    9

    The Renaissance    16

    Francis Bacon    19

    William Harvey    22

    Descartes's Synthesis    27

### **2    Inventing the Reflex    33**

    Enlightenment Views of Determinism in the Physical and Biological World    33

    Determinism in Geometrical Mathematics and Geometrical Physics    33

    Determinism and Behavior    36

    Nondeterministic Behavior    38

    The Birth of Analytic Mathematics: The End of Geometric World Models    40

    Beyond Clockworks: Analytic Models of the Determinate Brain    44

    Vaucanson's Duck in a Deterministic, but Analytic, World    51

<b>3</b>	<b>Charles Sherrington and the Propositional Logic of Reflexes</b>	<b>55</b>
	Testing the Limits of Determinate Analytic Mathematics	55
	Charles Scott Sherrington: The Confluence of Logic and Physiology	60
	Sherrington's System: The Logic of the Nervous System	63
	Dualism	68
	The Gödel Theorem: Finding the Limits of Determinate Mathematics	72
	Alan Turing and Computability	73
<b>4</b>	<b>Finding the Limits of the Sherringtonian Paradigm</b>	<b>77</b>
	Reflexes: Empirical Fact, Philosophical Paradigm, or Both?	78
	The Reflex Model Is Not Adequate to Account for All Determinate Behavior. Additional Mechanisms Are Required	80
	Sherrington's Cat	80
	T. Graham Brown and Internal Rhythms	82
	Erik Von Holtz: Adding to Reflex Theory	87
	Reflexes Are Not, as Sherrington Argued, the Organizational Element for Behavior. Behavior May Be Structured Hierarchically	95
	Paul Weiss	95
	Nickolai Bernstein	104
	Beyond Reflexes	108
<b>5</b>	<b>Neurobiology Today: Beyond Reflexology?</b>	<b>111</b>
	NetTalk, a Neural Network That Reads Aloud	113
	Classical Networks	113
	The NetTalk System	117
	Deciding Where to Look	122
<b>6</b>	<b>Global Computation: An Alternative to Sherrington?</b>	<b>131</b>
	David Marr	133
	Perceptrons and Computation	135
	Marr's Approach	137
	Vision	139
	Unresolved Problems with Marr's Approach	143
<b>7</b>	<b>Modularity and Evolution</b>	<b>145</b>
	Modules	146
	Psychological Modules	149
	Neurobiological Modules	150

Evolution	151
Gould and Lewontin	153
The Need for an Optimal Benchmark: Defining the Evolutionary Goals of Neural Computation	154
Achieving a Defined Goal: Phototransduction	156
Convergent Evolution: Cichlid Fishes	159
Generalizing to Complex Systems?	164
Marr, Evolution, and Modules: The Road Ahead	166
<b>II Neuroeconomics</b>	<b>169</b>
<b>8 Defining the Goal: Extending Marr's Approach</b>	<b>171</b>
The Goal of Behavior	171
Replacing Minimal Complexity: Inclusive Fitness	172
Replacing Determinate Models: Probability Theory	175
Uncertainty, Value, and Economics	177
The Birth of Probability Theory	178
Pascal's Idea: Combining Value and Probability	187
A Critical Advance in Valuation: Bernoulli	189
A Critical Advance in Probability: Bayes and Laplace	192
Thomas Bayes	193
Pierre-Simon Laplace	197
Valuation, Probability, and Decision: Foundations of Modern Economic Theory	199
Evolving Optimal Solutions or Optimal Brains?	200
Summary	202
<b>9 Evolution, Probability, and Economics</b>	<b>205</b>
Behavioral Ecology as a Theoretical Approach	206
Foraging Theory	208
The Prey Model	211
Empirical Tests of Foraging Economics	217
Conclusions from Testing the Prey Model	221
Summary	222
<b>10 Probability, Valuation, and Neural Circuits: A Case Study</b>	<b>225</b>
An Overview of Visual-Saccadic Processing	226
Visual Processing in the Primate Brain	226
Eye Movements and the Primate Brain	229
Linking Vision and Saccades	231
The Visual-Saccadic Function of Parietal Cortex	233
The Command Hypothesis	234

Attentional Enhancement	237
Attention Versus Intention	242
Resolving the Attention-Intention Debate?	250
The Cued Saccade and Distributed Cue Experiment	251
An Alternative Approach: Goals, Probability, and Valuation	255
Encoding Probability	256
Encoding Valuation	261
Variables That Guide Choice Behavior	263
Summary	266
Falling into the Dualist Trap	268
<b>11 Irreducible Uncertainty and the Theory of Games</b>	<b>271</b>
Irreducible Uncertainty in a Populated World	273
Billiard Balls	273
Flipping a Laplacian Coin	275
The Theory of Games	276
An Introduction to Game Theory	278
Opponent Actions and Expected Utility	281
John Nash and Modern Game Theory	282
Limitations of the Equilibrium Approach	287
Biology and the Theory of Games	288
The Hawk-Dove Game	289
Can Animals Really Produce Unpredictable Behaviors?	293
Applying Game Theory to Animal Behavior	294
Summary	297
<b>12 Games and the Brain</b>	<b>299</b>
Volition, Free Will, and Mathematical Games	299
Playing the Inspection Game	300
Theory	301
Behavior	304
Summary	309
Shifting to a Single Player	309
Game-Playing Monkeys	311
The Physiology of a Complex Behavior	313
Summary	317
<b>13 Putting It All Together I. Behavior and Physiology</b>	<b>319</b>
The Neuroeconomic Program	319
Using Neuroeconomics	321

Neuroeconomic Examples	322
Example 1: Visual Attention	323
Example 2: Evaluating Visual Motion	328
Example 3: Learning Prior Probabilities	330
Example 4: Learning About Values	332
Limits of the Theory: Will It Be Good Enough?	334
Summary	336
<b>14 Putting It All Together II. Philosophical Implications</b>	<b>337</b>
Classical Dualism and Physiological Monism	337
Alternatives to Classical Dualism and Physiological Monism	338
Free Will	340
Consciousness	342
Finis	344
References	347
Index	355
